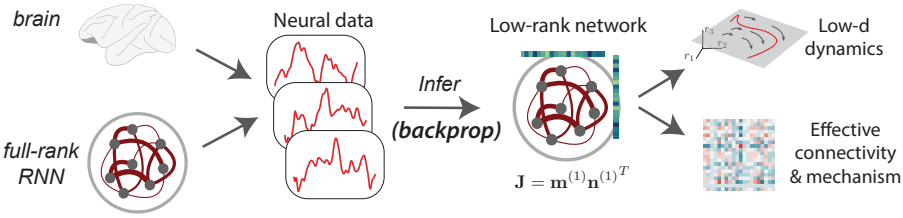
Abstract

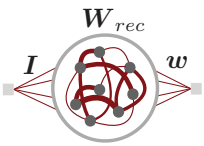
- Trained RNNs can offer good descriptions of collective neural activity, but are hard to interpret.
- Low-rank networks keep similar characteristics yet offer great intepretability.
- We present LINT (Low-rank Inference from Network Trajectories), a method to infer interpretable connectivity from recorded trajectories.
- Our method retrieves low-dimensional subspaces from neural activity and neural mechanisms from which it arises.

Approach: fitting low-rank RNNs to neural recordings



Classes of networks

flexibility ↓ interpretability



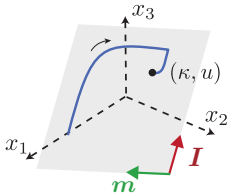
Full-rank RNN: $\mathcal{O}(N^2)$ parameters

Trainable $\boldsymbol{W}_{rec}, \boldsymbol{I}, \boldsymbol{w}$

Low-rank RNN: $\mathcal{O}(N)$ parameters

[Mastrogiuseppe & Ostojic 2018]

$$\boldsymbol{W}_{rec} = \sum_{r=1}^{R} \boldsymbol{m}^{(r)} \boldsymbol{n}^{(r)T}$$



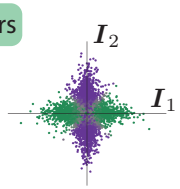
Trainable $\boldsymbol{m}^{(r)}, \boldsymbol{n}^{(r)}$

Dynamics on R-dim subspace:

$$\boldsymbol{x}(t) = \sum_{r=1}^{R} \kappa_r(t)\boldsymbol{m}^{(r)} + \sum_{s=1}^{N_{in}} v_s(t)\boldsymbol{I}^{(s)}$$

Multi-population RNN: $\mathcal{O}(1)$ parameters

[Dubreuil, Valente et al. 2020]



$$(m_i^1, n_i^1, I_i, w_i) \sim \sum_{p=1}^{P} \mathcal{N}(\boldsymbol{\mu}_p, \boldsymbol{\Sigma}_p)$$

Trainable $(\boldsymbol{\mu}_p, \boldsymbol{\Sigma}_p)$

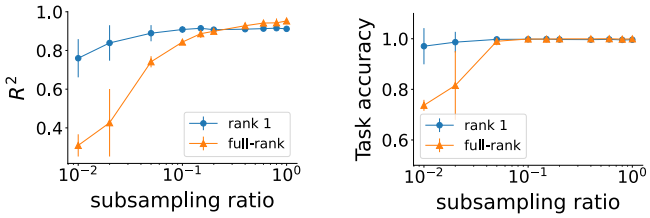
Analytically tractable dynamics:

$$\dot{\kappa}_1 = -\kappa_1 + \tilde{\sigma}_{n_1 m_1}\kappa_1 + \tilde{\sigma}_{n_1 m_2}\kappa_2 + \tilde{\sigma}_{n_1 W_{in}} u(t)$$
$$\dot{\kappa}_2 = -\kappa_2 + \tilde{\sigma}_{n_2 m_1}\kappa_1 + \tilde{\sigma}_{n_2 m_2}\kappa_2 + \tilde{\sigma}_{n_2 W_{in}} u(t)$$

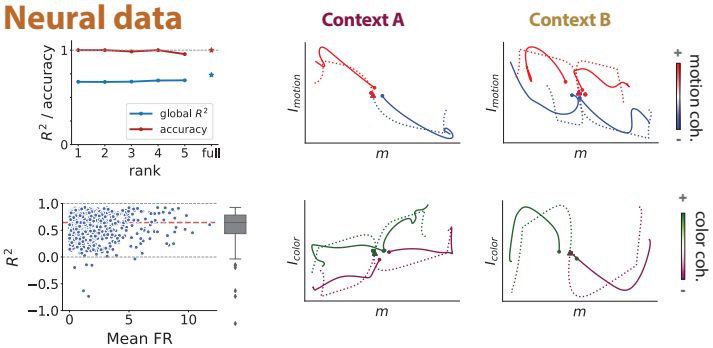
with functional connectivities: $\tilde{\sigma}_{ab} = \sum_{p=1}^{P} \sigma_{ab}^p \langle \phi' \rangle_p$

Neuron subsampling

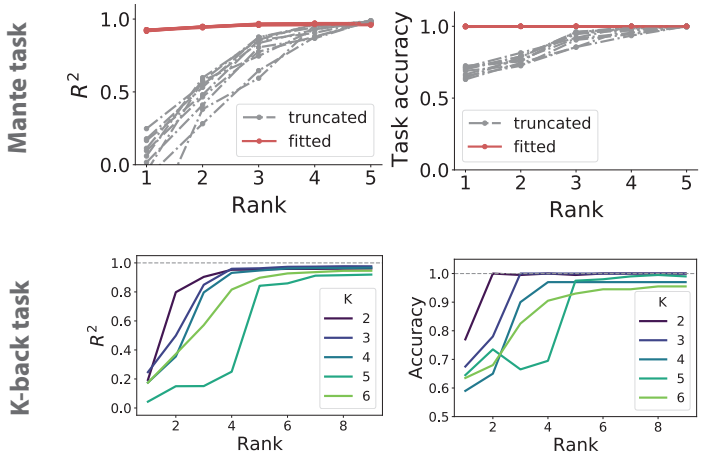
Results for networks fitted to subsampled trajectories of a full-rank, 1000 neurons network



Neural data

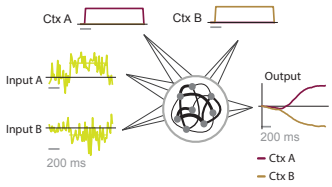


Reproducing full-rank nets with low-rank ones

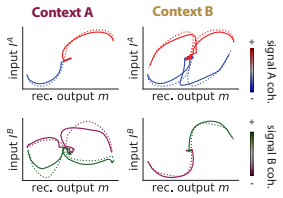


"Opening the black box" of a full-rank network

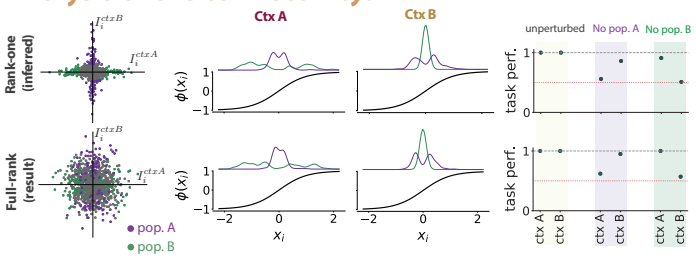
Task:



Low-dimensional dynamics:



Analysis of the connectivity:



Take-home messages

- Networks with a very low-rank connectivity can capture the main aspects of dynamics of unconstrained RNNs and recorded neural data.
- They provide a way to dissect mechanisms in black-box RNNs and make them more interpretable.
- They bridge dimensionality reduction with the computational requirements of the studied task.
